Foreword

The social security program covers nearly all private employment, most of State and local government employment, and some Federal employment. The earnings distribution of workers covered by social security, as presented in this volume, the fourth in a series, thus provides a substantially complete accounting of earned income in the United States. Detailed earnings tabulations from the decennial censuses of population are available for years ending in "9"; thus volumes in the *Earnings Distributions* series are now scheduled for years ending in "4" and "9" to permit comparability with census data and to provide mid-census information.

Material in *Earnings Distributions in the United States, 1974* can serve as a data base for a wide variety of research purposes, including the measurement of income adequacy and the identification of geographic areas having large groups of workers with low earnings. Furthermore, the data can provide a basis for measurement of trends, not only in income levels, but also in the convergence or divergence of earnings patterns in large and small metropolitan areas and in different regions of the country. Many of these research objectives can be met despite the gap between the year of reference and year of publication.

Earnings and employment data as reported by the employer are classified in this publication by geographic location, age, sex, race, and whether or not the worker had earnings credited for four quarters in the year. Geographic classifications generally reflect place of employment of the major job. The class of worker designation by number of quarters of employment provides a basis for measuring the extent of attachment to the labor force.

Planning for this series on earnings distributions grew out of work initiated by Mollie Orshansky of the Division of Supplemental Security Studies.

The volume was prepared under the direction of the Director of the Division of OASDI Statistics, Henry F. Patt. Bertram M. Kestenbaum was responsible for coordination, data review, and preparation of the text under the direction of Erma W. Barron, Chief of the Earnings and Employment Statistics Branch. Creston M. Smith, Statistical Operations Branch, supervised the operational work with the assistance of Adah D. Enis and Joseph H. Salis. The tables of sampling variability and the description of the sample design were prepared by Carolyn A. Harrison of the Management Statistics and Services Branch, under the direction of Joseph D. Dorsey.

Special acknowledgements are due for the development and processing of basic coded source materials, performed by the Office of Data Services staff under the supervision of its Director, Donald V. Brown. In particular, Salvatore J. D'Avella and Richard E. Mason were responsible for creating the basic record files.

Introduction

General

Earnings Distributions in the United States, 1974 is a tabular presentation of earnings data for wage or salary and self-employed workers participating in the social security program through contributions on their earned income in 1974. It is one of a series; the previous issue contained data for 1969, and the next issue is planned to describe earnings in 1979.

For the United States as a whole, for each of the States, and for certain groupings of States (called "regions" and "divisions"), the target population is arrayed according to various demographic, work-force, and locality classifiers. Both earnings distributions and means (averages) are provided for each cell. Data are also presented separately for the 120 largest metropolitan areas in the country, as of July 1, 1974. In addition, in the interests of comparability with the previous issue in this series, data are presented separately for the five metropolitan areas which were among the 120 largest at the time of the 1970 census, but are no longer so.

The statistical system maintained by the Social Security Administration (SSA) to supply information relevant to covered employment and earnings is designed to provide a sample of approximately 1 percent of individuals in any designated target population. The system projects data from tax returns filed by employers and self-employed people on a background fashioned from various informational forms and records used in administering the social security program, such as applications for social security and employer identification numbers.

This report has been designed so that each user can combine cells in ways meaningful to his individual needs; there is, therefore, no suppression of small cells. Caution must, of course, be exercised in basing inferences on small sample estimates. The tables of sampling variability appended to the report are the appropriate tools for judging statistical significance.

Although approximately 90 percent of the Nation's workers have covered employment, that is, subject to either the Federal Insurance Contributions Act (FICA) or the Self-Employment Contributions Act (SECA), Federal Government employees under a statutory retirement system and railroad workers are excepted from coverage, and coverage is elective for State and local governments and nonprofit charitable, religious, educational, etc. organizations. In addition, some types of employment must meet cash-pay minimum or regularity-of-employment tests: self-employment, agriculture, household, tip, nonprofit organization, and work not in the course of the employer's trade or business.

Thus, there are limitations on the statistics of employment and earnings in *Earnings Distributions in the United States, 1974*: the target population is less than the whole of the labor force in 1974, and for individuals with both covered and noncovered employment, covered earnings are less than total earnings.

Also, the true size of the target population is slightly understated by the published estimate in this report. There is a relatively minor amount of incomplete information on individual earnings because of faulty or missing social security number identification and delinquent filing of tax returns. Though the magnitude of the understatement could have been estimated, its effects on the distributions would be difficult to gauge.

The data file on which this publication is based, as well as numerous other sample files, are available on a reimbursable basis to outside researchers. Interested persons should contact the Office of Research and Statistics, Social Security Administration, 1875 Connecticut Avenue, N.W., Washington, D.C. 20009.

Terminology

Age.—Age attained during 1974.

Four-quarter worker.—For the majority of workers, that is, those reported by their employers on a quarterly tax form, a four-quarter worker is one who either has been reported in each quarter of the year or who has earned the taxable maximum. For farmworkers and the self-employed, both reported on an annual tax form, a four-quarter worker has taxable earnings of $400.[1] The four-quarter worker concept is intended to be a rough measure of a strong attachment to the covered labor force.

Metropolitan area.—Except in New England, a county or group of counties designated, formerly by the Office of Management and Budget and presently by the Secretary of Commerce, as a Standard Metropolitan Statistical Area (SMSA). Revisions made after July 1, 1974, are not reflected in this publication.

The designation of a Standard Metropolitan Statistical Area is contingent on a city, or a city and the surrounding community, reaching a population level of 50,000. Generally an SMSA is composed of the county or counties containing the central city or cities and those contiguous counties which are essentially metropolitan in character and are socially and economically integrated with the

[1] Not reflected in this report is the fact that the four-quarter worker concept was abandoned in 1978 with the change to annual reporting for all workers.

county (counties) of the central city (cities). In New England, however, SMSA's are composed of cities and towns, rather than counties. Since the statistical system of the Social Security Administration uses the county as the basic geographic unit, it is necessary to translate the New England SMSA into some county-equivalent. Fortunately, an OMB-appointed task force, following the same criteria used in defining SMSA's in other States, has developed a list of 13 New England County Metropolitan Areas (NECMA's).

United States total.—Includes the 50 States and District of Columbia, Puerto Rico, the Virgin Islands, Guam, and American Samoa. Also included are employment on American ships at sea and the employment of U.S. citizens abroad by American employers or their foreign subsidiaries.

Regions, divisions.—Geographic groupings of States, as follows:

I. Northeastern Region
- (1) New England Division ..... Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, Vermont
- (2) Middle Atlantic Division ..... New Jersey, New York, Pennsylvania

II. North Central Region
- (3) East North Central Division..... Illinois, Indiana, Michigan, Ohio, Wisconsin
- (4) West North Central Division .... Iowa, Kansas, Minnesota, Missouri, Nebraska, North Dakota, South Dakota

III. Southern Region
- (5) South Atlantic Division ..... Delaware, District of Columbia, Florida, Georgia, Maryland, North Carolina, Virginia, West Virginia
- (6) East South Central Division ..... Alabama, Kentucky, Mississippi, Tennessee
- (7) West South Central Division ..... Arkansas, Louisiana, Oklahoma, Texas

IV. Western Region
- (8) Mountain Division ..... Arizona, Colorado, Idaho, Montana, Nevada, New Mexico, Utah, Wyoming
- (9) Pacific Division..... Alaska, California, Hawaii, Oregon, Washington

Total earnings.—The sum of wage or salary income and net self-employment income, unless the former reaches the taxable maximum ($13,200 in 1974). In that event, (a) SSA has no knowledge of any self-employment activity; and (b) the actual wage or salary income must be estimated, according to a procedure described in the paragraph below. Since the last interval in the published earnings distributions is "$13,200 and over," distributions are not affected by these uncertainties the way the published averages are.

"Limit quarter" is a name given to the calendar quarter in which an individual's wage or salary earnings reach the taxable maximum—$13,200 in 1974. To estimate wage or salary earnings above this figure, that calendar quarter is determined that is closest to the limit quarter for which reported wages exceeded the limit quarter wage. Then, the wages of the quarter so determined are imputed to the limit quarter and all subsequent quarters. If there is no quarter with reported wages greater than the limit quarter wage, then (unless the limit quarter is the first quarter) the limit quarter wage is imputed to the limit quarter and all subsequent quarters. If the limit quarter is the first quarter, earnings of $93,200 for men and $91,500 for women are imputed, on the assumption that individuals with very high earnings can be described by an appropriate Pareto distribution. Finally, for farmworkers, reported annually, who reach the taxable maximum, the assumed average is $19,500.

Presentation of the Data

Unknown age, race, sex.—For an estimated 10,800 individuals, age has not been ascertained. These people are not represented in the distributions by age, but only in totals and subtotals. For an estimated 2.3 million individuals, racial designation has not been ascertained. In this publication "unknown" race is combined with "white." Sex identification is complete.

Place of employment vs. place of residence.—The geographic classification is based on county of employment for wage or salary workers and county of residence for self-employed workers.

Uniqueness of geographic classification.—A single individual may have employment during the year in two or more counties. A unique location is created by adopting a "major job" concept, that is, the place of employment where the individual's earnings were highest.

Accuracy and completeness of geographic classification.—In the case of multiestablishment employers, it is necessary to properly associate a worker with the particular physical site at which he is employed. The Establishment Reporting Plan (ERP) was developed to meet this need. Although most multiunit firms do cooperate with this voluntary plan, the lack of universal acceptance of ERP presents a limitation on the geographic detail of the data.

A small number (140,900) of workers in Guam or American Samoa or on ships at sea or in foreign lands necessarily appear in no State table but only in the United States total. Additionally, for almost 2.9 million workers (of whom 2.7 million are in the military or reserves) data are presented in the same way because their geographic

location is not determinable from SSA data sources. For another 0.8 million workers, the State of employment has been determined but the county of employment has not. These workers are not classified either as metropolitan or as nonmetropolitan.

As some State Governments file a single report for all their covered employees, these workers will be classified in the county containing the State capital. In particular, in Puerto Rico there is a significant overstatement of metropolitan employment and of employment in the San Juan SMSA because almost all State employees appear to be employed in the San Juan Municipio.

SMSA's (including NECMA's) which cross State lines.—In this volume, data for each of the 125 SMSA's whose size warrants a separate tabulation follow the table for the metropolitan component of the State containing that SMSA. For large SMSA's which cross State lines, the SMSA table is placed after the metropolitan component of the State which contains the SMSA's central city (or largest central city). This is always the first State named in the SMSA title. The metropolitan component of the State, however, includes only those SMSA counties in the State.

These 21 large SMSA's cross State lines:
- Allentown-Bethlehem-Easton, Pa.-N.J. SMSA
- Binghamton, N.Y.-Pa. SMSA
- Boston-Lowell-Brockton-Lawrence-Haverhill, Mass.-N.H. NECMA
- Chattanooga, Tenn.-Ga. SMSA
- Cincinnati, Ohio-Ky.-Ind. SMSA
- Davenport-Rock Island-Moline, Iowa-Ill. SMSA
- Duluth-Superior, Minn.-Wis. SMSA
- Huntington-Ashland, W. Va.-Ky.-Ohio SMSA
- Kansas City, Mo.-Kans. SMSA
- Louisville, Ky.-Ind. SMSA
- Memphis, Tenn.-Ark. SMSA
- Minneapolis-St. Paul, Minn.-Wis. SMSA
- New York, N.Y.-N.J. SMSA
- Norfolk-Virginia Beach-Portsmouth, Va.-N.C. SMSA
- Omaha, Nebr.-Iowa SMSA
- Philadelphia, Pa.-N.J. SMSA
- Portland, Oreg.-Wash. SMSA
- St. Louis, Mo.-Ill. SMSA
- Toledo, Ohio-Mich. SMSA
- Washington, D.C.-Md.-Va. SMSA
- Wilmington, Del.-N.J.-Md. SMSA

Comparability of Data With Other Federal Statistics

Primarily because of the limitation to covered employment and the uncertainties which are a product of the taxable ceiling of $13,200, the data in *Earnings Distributions in the United States, 1974* are not strictly comparable to other Federal statistics on personal income, such as the Internal Revenue Service's *Statistics of Income, Individual Tax Returns for 1974* and the Bureau of the Census' *Income of Families and Persons in the United States: 1974 (Current Population Reports—Consumer Income).*

Also, changes in the boundaries of SMSA's and, in New England, of SMSA equivalents between the 1970 Census of Population and July 1, 1974, affect the comparability of data in this issue with those for earlier years.

Standard Footnotes to Tables

[1]Age attained during 1974. Workers of unreported ages are included in the taxable-earnings-interval subgroup totals.

[2]White, black, other, and unknown.

[3]Includes workers of unknown race.

[4]Nonfarm wage and salary workers with earnings of $1 or more in all four calendar quarters of the year, or total earnings of $13,200 or more; farm wage and salary workers and self-employed workers with annual earnings of $400 or more. A worker with both farm and nonfarm wages and salaries is credited with a quarter of employment for each hundred dollars of farm earnings and for each calendar quarter with nonfarm earnings of $1 or more.

[5]The sum of taxable wages, estimated (see p. viii) wages above the $13,200 taxable limit, and self-employment net earnings.

Appendix A

Population and constituent counties of the 120 largest metropolitan areas in the United States, by State: July 1, 1974[1]

State, SMSA, and constituent counties	Population	Rank
Alabama:		
Birmingham, Ala. SMSA	784,400	48
Jefferson County		
St. Clair County		
Shelby County		
Walker County		
Mobile, Ala. SMSA	395,300	92
Baldwin County		
Mobile County		
Arizona:		
Phoenix, Ariz. SMSA	1,180,200	30
Maricopa County		
Tucson, Ariz. SMSA	427,000	85
Pima County		
Arkansas:		
Little Rock-North Little Rock, Ark. SMSA	358,700	101
Pulaski County		
Saline County		
California:		
Anaheim-Santa Ana-Garden Grove, Calif. SMSA	1,655,100	19
Orange County		
Bakersfield, Calif. SMSA	337,000	108
Kern County		
Fresno, Calif. SMSA	439,400	83
Fresno County		
Los Angeles-Long Beach, Calif. SMSA	6,930,400	3
Los Angeles County		
Oxnard-Simi Valley-Ventura, Calif. SMSA	426,700	86
Ventura County		
Riverside-San Bernardino-Ontario, Calif. SMSA	1,205,800	29
Riverside County		
San Bernardino County		
Sacramento, Calif. SMSA	865,600	42
Placer County		
Sacramento County		
Yolo County		
San Diego, Calif. SMSA	1,520,500	20
San Diego County		
San Francisco-Oakland, Calif. SMSA	3,129,600	7
Alameda County		
Contra Costa County		
Marin County		
San Francisco County		
San Mateo County		
San Jose, Calif. SMSA	1,152,800	31
Santa Clara County		
Stockton, Calif. SMSA	297,800	117
San Joaquin County		
Colorado:		
Colorado Springs, Colo. SMSA	292,700	119
El Paso County		
Teller County		
Denver-Boulder, Colo. SMSA	1,399,700	24
Adams County		
Arapahoe County		
Boulder County		
Denver County		
Douglas County		
Gilpin County		
Jefferson County		
Connecticut:		
Bridgeport-Stamford-Norwalk-Danbury, Conn. NECMA	790,200	47
Fairfield County		
Hartford-New Britain-Bristol, Conn. NECMA	1,058,600	37
Hartford County		
Middlesex County		
Tolland County		
New Haven-Waterbury-Meriden, Conn. NECMA	760,000	52
New Haven County		
Delaware:		
Wilmington, Del.-N.J.-Md. SMSA	516,600	76
New Castle County, Del.		
Salem County, N.J.		
Cecil County, Md.		
District of Columbia:		
Washington, D.C.-Md.-Va. SMSA	3,008,500	8
District of Columbia		
Charles County, Md.		
Montgomery County, Md.		
Prince Georges County, Md.		
Alexandria city, Va.		
Fairfax city, Va.		
Falls Church city, Va.		
Fairfax County, Va.		
Arlington County, Va.		
Loudoun County, Va.		
Prince William County, Va.		
Florida:		
Fort Lauderdale-Hollywood, Fla. SMSA	818,700	45
Broward County		
Jacksonville, Fla. SMSA	683,200	57
Baker County		
Clay County		
Duval County		
Nassau County		
St. Johns County

Appendix B: Sample Design

Source of Data—The Continuous Work History Sample

Earnings distribution data for 1974 are obtained from the Social Security Administration's Continuous Work History Sample which is derived from the reporting and informational forms and records used in administering the social security program. Data on age, sex, and race are obtained from the employee application for a social security number; data on geographic area are obtained from the employer application for an identification number and related employer reports. Data on amount of earnings and employment are derived from the report forms submitted by employers and self-employed persons.

Sample Design

General description.—The Continuous Work History Sample (CWHS) is a 1-percent longitudinal sample consisting of all persons who have social security numbers (SSN's) with specified digits in the sixth, eighth and ninth positions and who have covered employment during the reference period. The sample for this report consists of persons working in covered employment during 1974. The digital selection pattern remains constant, so that employment and earnings histories beginning in 1957 are available for persons in the sample; additional earnings data are available beginning in 1937.

Sampling frame.—In a broad sense, the sampling frame for the CWHS consists of the one billion possible nine-digit SSN's. The digits of the SSN have the following significance:

Area in which number is assigned (3 digits)	*Group number* (2 digits)	*Serial number* (4 digits)
XXX	XX	XXXX

In the issuance of SSN's, each State is assigned one or more area numbers.[1] Thus the first three digits indicate the State where the initial application for an SSN was made (but not necessarily the location of subsequent employment). In most instances, all SSN's in a block of 9,999 SSN's having the same first five digits[2] were applied for in the same State and within a relatively short time period.

Sampling unit.—The sampling unit for CWHS is the SSN; however, the tabulations in this report are for persons with covered earnings. There is usually a one-to-one correspondence between SSN's and persons. However, a few persons have more than one SSN. If some of these persons receive wage credits from different employers and/or credits for self-employment earnings on more than one account number, the estimates of number of persons from the sample will be overstated. This effect is believed to be very small.

Stratification.—Since only the serial number portion of the SSN is used as a basis for selection, each block of 9,999 SSN's having the same first five digits (area-group number) may be considered a separate stratum. Thus, the sample is stratified by area and time of the initial application for an SSN.

Selection within strata.—The present digital sampling pattern evolved from earlier samples for which the sampling fractions were larger than the present 1 percent. The first of these samples was a 20-percent sample consisting of all SSN's with one of two specified digits in the sixth position (first digit of the serial number). The second sample was a subsample of the first, obtained by retaining all SSN's in the first sample with one of two specified digits in the ninth position of the SSN. This resulted in a 4-percent sample, that is,

$$\frac{2}{10} \times \frac{2}{10} = \frac{4}{100}$$

The present 1-percent sample was obtained by designating a one-in-four subsample of the 4-percent sample, using both the eighth and ninth positions of the SSN. As a result, the present CWHS sample consists of all SSN's with one of two specified digits in the sixth position and one of five specified two-digit combinations in the eighth and ninth positions. While a different selection pattern might have been used if the initial sampling fraction had been 1 percent, the present sample has the very substantial advantage that data are available for all sample persons back through the start of coverage by the 20-percent sample.

Sample size.—The sample size for a particular year is approximately 1 percent of the persons with covered

[1] An exception to the use of area numbers as a State code was made for persons covered under the Railroad Retirement Act for whom social security numbers were issued. A special block of numbers was assigned to these railroad workers. Since July 1963, however, newly hired railroad workers are assigned numbers in the regular series.

[2] Numbers ending in 0000 are not assigned.

employment in that year. For 1974, the sample size was 998,369 persons (SSN's), of whom 745,601 were four-quarter workers.

Estimation procedure.—Estimates of numbers of persons in this report are obtained by multiplying the sample counts by 100. All estimates of numbers of persons are given in thousands.

Sampling and Nonsampling Errors

Estimates based on samples can be expected to differ, because of sampling variability, from figures that would have been obtained had all, rather than specified samples, of the records been used for the compilations. The standard error is a measure of sampling variability. Sixty-eight percent of all possible probability samples selected with the same specifications would give estimates within one standard error of the figure obtained from a compilation of all records. Similarly, 95 percent of all possible probability samples would give estimates within two standard errors and 99 percent of all possible probability samples would give estimates within 2½ standard errors. The standard error of an estimate depends on design elements such as the method of sampling, the sample size, and the estimation process.

Because of the large number of data cells shown in this publication, it was not practical to calculate the standard error for each cell. However, the standard error was estimated for a large number of cells within each geographical area shown. These standard error estimates were then used to fit a regression curve to provide estimates of approximate standard errors for each geographic area.

The stratification and clustering effects of the sample design were taken into account in estimating standard errors. Within each stratum, the estimated variance for each variable was a function of the squared difference between the sample counts or aggregates for the two clusters defined by the sixth digit of the SSN.

Sampling variability of estimated number of persons.—The data in table A1-1 provide approximate standard errors of estimates for the total United States, regions, and divisions; table A1-2 gives estimated standard errors for the United States, regions, and divisions for nonmetropolitan areas; table A1-3 shows estimated standard errors for the United States, regions, and divisions for metropolitan areas. Tables A2-1, A2-2, and A2-3 provide estimated standard errors of State estimates for total, nonmetropolitan, and metropolitan areas, respectively. Table A3 provides estimated standard errors for specified standard metropolitan statistical areas. Linear interpolation may be used for estimated numbers not shown in the tables.

Illustration of the use of the A series tables.—Table 41 shows that there were an estimated 5.8 thousand male white workers under age 25 with earnings in the $5,000-$7,499 interval in Montana.

Step 1.— Locate the two listed values between which 5.8 thousand falls in table A2-1. These are 5.0 thousand and 7.5 thousand.

Step 2.— For each of the estimate values found in step 1, find the corresponding standard errors. These are 0.7 thousand and 0.9 thousand, respectively.

Step 3.— Calculate the proportional part P of the interval between 5.0 thousand and 7.5 thousand which is contained between 5.0 thousand and 5.8 thousand.

$$P = \frac{5800 - 5000}{7500 - 5000} = 0.32$$

Step 4.— Calculate the sampling error S.

$$S\,5{,}800 = S\,5{,}000 + P*[\,S\,7{,}500 - S\,5{,}000\,]$$

The sampling error is

$$S\,5{,}800 = 700 + 0.32(900 - 700) = 764.0$$

Therefore, by interpolation the approximate standard error of these 5.8 thousand workers is about 0.8 thousand. Consequently, the lower and upper 68-percent confidence limits are 5.0 and 6.6 thousand, respectively.

Sampling variability of estimated percentage of persons.—The reliability of an estimated percentage depends on both the size of the percentage and on the size of the total upon which the percentage is based. The standard errors shown in the bodies of the tables are expressed as percentage points. The bases shown are expressed in terms of inflated data (in thousands).

The data in table B1-1 provide approximate standard errors of estimated percentages for the total United States, regions, and divisions; table B1-2 gives estimated standard errors for the United States, regions, and divisions for nonmetropolitan areas; table B1-3 shows estimated standard errors for the United States, regions, and divisions for metropolitan areas. Tables B2-1, B2-2 and B2-3 provide estimated standard errors for State estimates for total, nonmetropolitan, and metropolitan areas, respectively. Table B3 gives estimated standard errors for specified standard metropolitan statistical areas. Linear interpolation may be used for percentages and base figures not shown in the tables.

Illustration of the use of the B series of tables.—Table 40-B-2 shows that 27.1 percent of the female four-quarter workers in the St. Louis, Mo.-Ill. SMSA had earnings in the $2,500-$4,999 interval. The base of the percentage is 300.4 thousand.

Step 1.— Locate the two listed percent estimates between which 27.1 percent falls in table B3. These are 25 and 50 percent.

Step 2.— Let $S\,(p;N)$ denote the sampling error of an estimate of p percent on a population base of N. Perform linear interpolation to obtain S(25 percent; 300.4 thousand) and S(50 percent; 300.4 thousand); that is, compute P, the proportional part of the interval between 100,000 and 500,000 which is between 100,000 and 300.4 thousand.

$$P = \frac{300{,}400 - 100{,}000}{500{,}000 - 100{,}000} = .501$$

Compute the sampling error S.

$$\begin{aligned} S(25 \text{ percent; } 300{,}400) &= S(25 \text{ percent; } 100{,}000) \\ &\quad - P \cdot [S(25 \text{ percent; } 100{,}000) \\ &\quad - S(25 \text{ percent; } 500{,}000)] \\ &= 1.5 - .501(1.5 - 0.7) = 1.15 \end{aligned}$$

Similarly

$$S(50 \text{ percent; } 300{,}400) = 1.8 - .501(1.8 - .9) = 1.35$$

Step 3.— Perform linear interpolation to obtain the proportional part of the interval between 25 and 50 which lies between 25 and 27.1.

$$P = \frac{27.1 - 25}{50 - 25} = .084$$

$$\begin{aligned} S(27.1 \text{ percent; } 300{,}400) &= S(25 \text{ percent; } 300{,}400) \\ &\quad + P \cdot [S(50 \text{ percent; } 300{,}400) \\ &\quad - S(25 \text{ percent; } 300{,}400)] \end{aligned}$$

The sampling error is

$$\begin{aligned} S(27.1 \text{ percent; } 300{,}400) &= 1.15 \\ &\quad + .084(1.35 - 1.15) \\ &= 1.17 \end{aligned}$$

Using two-way linear interpolation, a standard error of 1.2 percent is derived. Thus, the 68-percent confidence interval for this estimated percent is from 25.9 to 28.3 percent.

Sampling variability of estimated mean earnings.—A rough approximation to the standard error of an estimate of mean earnings can be obtained by using the following formula:

$$\frac{\sigma}{\bar{X}} = \sqrt{R \left[\frac{\sum_{i=1}^{C} P_i X_i^2}{n} - \frac{\bar{X}^2}{n} \right]}$$

where n is the weighted total number of persons in all C income classes;

P_i is the percentage of total persons in the ith income class;

X_i is the midpoint of the ith class;

$\bar{X}$ is the mean income of the distribution

$$\sum_{i=1}^{C} P_i X_i \ ;$$

R is a constant which depends on the sample size, the sample design, and the estimation procedure. For calculations in this report, $R = 129$ may be used.

Comparison with simple random sampling.—The CWHS sample design differs in several ways from a simple random sample. Some of these features increase the efficiency of the sample design; others tend to produce somewhat larger sampling errors.

The stratification of the sampling frame by area-group numbers increases efficiency by insuring the selection of the same proportion of SSN's applied for in different areas and during different time periods. On the other hand, the selection procedure within strata is in some respects analogous to cluster sampling with subsampling. Thus, within a stratum (block of SSN's), if each group of 1,000 SSN's with the same sixth digit is considered to be a cluster, then the sampling procedure is to select two of these 10 clusters, and then to subsample by selecting 5 percent of the units in each cluster, based on the eighth and ninth digits.

The SSN assignment procedure currently in use assures that numbers within a block or stratum are assigned in random order. For blocks of SSN's assigned under this system, there should be no design effect (increase in variance over simple random sampling) from the use of cluster sampling. However, earlier blocks were assigned in serial order; and in the early days of the program, numbers in sequence were sometimes assigned to homogeneous groups such as the employees of one company. In these blocks, for some variables estimated from the sample a significant design effect can be anticipated.

The average net effect of these design features has been determined by comparing the standard errors calculated for specific items with those that would have been obtained for the same items from simple random samples of the same size. This comparison shows that the design effect on the standard errors ranges from 0 to about 25 percent, and that for most items tested it was in the lower half of this range.

Nonsampling errors.—The nature of the social security program and the manner in which it is administered lead to some errors that would be present in a complete compilation of records as well as in a sample. Some factors contributing to nonsampling errors are: (1) failures to report, tax, and credit some covered earnings; (2) reporting and processing errors in the demographic and geographic classifiers for persons in the sample; (3) duplication in the estimates of workers as a result of persons receiving wage and/or self-employment credits on more than one account number; and (4) corrections and additions to earnings records made subsequent to the processing cutoff date for the annual CWHS file. (This report is based on 1974 earnings for which wage and salary reports were received through September 1975 and self-employment reports through September 1976. It is estimated that these files were 98 percent complete on their respective cutoff dates.)
